Documentation of the BEMCmpMgr (CEC Compliance Manager) DLL
For Analysis of Residential Buildings
SAC 11/7/2019 (v22) (recent changes in Red font)

The purpose of this document is to provide information needed to develop software interfaces to the CEC Compliance engine DLL(s). The primary library third party tools will interface with is BEMCmpMgr19r.dll for 2019 analysis. These DLLs manage the compliance analysis processing, including:

- Evaluation of compliance rules on user input building models (via BEMProc19r.dll for 2019),
- Simulation of the proposed and standard building models (via CSE.exe for all enduses, including DHW), and
- Generation of compliance reports (informal reports internal to compliance manager, certified reports via web-based report generator).

The analysis engine DLLs are now based solely on open source dependencies (primarily boost, Qt C++ & OpenSSL libraries), whereas the CBECC-Res UI still requires Microsoft (Windows) libraries.

There are only a handful of exports needed to perform compliance analysis and retrieve analysis results/reports. One performs the analysis (and potentially generates a report), another to generate a draft report from an existing analysis results file, three more enable the retrieval of data (inputs and/or results) from the building model following analysis, a couple more to retrieve error messages and the last is used to clean-up following exit.

Recommended sequence of events (assuming use of Visual Studio & C++) for a scenario where direct linking to the compliance manager DLLs is not required:

1. Load the pertinent DLLs via LoadLibrary() -->> "libeay32.dll" , "ssleay32.dll" , "Qt5Core.dll", "Qt5Xml.dll", "Qt5Gui.dll", "Qt5Network.dll", "Qt5WebKit.dll", "Qt5Widgets.dll", and then "BEMProc19r.dll" and "BEMCmpMgr19r.dll" (for 2019 analysis).
   This step MAY not be required if the third party application and these referenced DLLs are located in the same directory.

2. Call GetProcAddress() to retrieve function pointers to each DLL function you plan to call.

3. For each building model to be simulated:
   - Call `CMX_PerformAnalysis_CECRes()` to perform the compliance analysis. An Alternative here is to use `CMX_PerformAnalysisCB_CECRes()` if you wish to provide a callback function pointer enabling progress monitoring and mid-analysis abort within your application.
   - If the desired compliance report(s) are not generated via the Analysis call above, then call `CMX_GenerateReport_CEC()` (or `CMX_GenerateReport_Proxy_CEC()` to provide proxy server info) to generate a PDF compliance report based on the results contained in an XML file identified by the calling application.
   - Call `CMX_GetDataString()`, `CMX_GetDataInteger()`, &/or `CMX_GetDataFloat()` any number of times to retrieve building model inputs, calculated defaults or simulation results (anything stored in the building model).
   - Call `CMX_PopulateCSVResultSummary_CECRes()` to populate a character string with results of a

compliance analysis run.
- Call `CMX_GetRulesetErrorCount()` to retrieve the number of errors encountered during the analysis and `CMX_GetRulesetErrorMessage()` to retrieve individual error message character strings.
- Call `CMX_PopulateCSVHourlyResults_CECRes()` to export a CSV file containing hourly simulation results and TDV multipliers for a single analysis run (proposed vs. standard…).

4. Call `CMX_ExitBEMProcAndCmpMgrDLLs()` following all simulations to clean-up BEMProc & BEMCmpMgr data.

5. Unload the loaded DLLS (in reverse order) via FreeLibrary() -->> "BEMCmpMgr19r.dll" and "BEMProc19r.dll" (for 2019), then "Qt5Widgets.dll", "Qt5WebKit.dll", "Qt5Network.dll ", "Qt5Gui.dll", "Qt5Xml.dll", "Qt5Core.dll", "ssleay32.dll", and "libeay32.dll"
This step not required if the third party DLLs are not explicitly loaded in step 1.

Function Reference

The following are names and documentation pertaining to the compliance manager routines referenced above

```
int CMX_PerformAnalysis_CECRes(                  const char* pszBEMBasePathFile,
            const char* pszRulesetPathFile,      const char* pszCSEEXEPath,
            const char* pszCSEWeatherPath,       const char* pszDHWDLLPath,
            const char* pszDHWWeatherPath,       const char* pszProcessingPath,
            const char* pszModelPathFile,        const char* pszLogPathFile,
            const char* pszUIVersionString,      bool bLoadModelFile,
            const char* pszAnalysisOptionsCSV,
            char* pszErrorMessage,               int iErrorMsgLength,
            bool bDisplayProgress,               HWND hWnd,
            int iSecurityKeyIndex,               const char* pszSecurityKey );

      // typedef int  (__cdecl *PCMX_PerformAnalysis_CECRes)(  const char*,
      //                       const char*, const char*, const char*,
      //                       const char*, const char*, const char*,
      //                       const char*, const char*, const char*, bool,
      //                       const char*, char*, int, bool, HWND, int,
      //                       const char* );
      // _CMX_PerformAnalysis_CECRes
```

where:

- pszBEMBasePathFile is a null terminated string containing the path and filename of the data model definitions file. This should not be specified (pass in NULL) unless the run being performed uses a different data model as the one previously used to initialize the DLLs or perform a simulation.
- pszRulesetPathFile is a null terminated string containing the path and filename of the ruleset file used to process the building model and generate the CSE simulation inputs. This should be specified for each run when switching building models, as it re-initializes both the building model and ruleset data. In the CBECC-Res installer, this would be: '<Data directory>\Rulesets\CA Res 2019.bin' (for 2019 analysis).
If a simulation is to be performed on a building model already loaded into memory, then you can specify NULL for this argument.

- pszCSEEXEPath is a null terminated string containing the path (including trailing '\') of the directory where the CSE executable (and ashwat.dll) reside. In the CBECC-Res installer, this would be: '<Program directory>\CSE\'.
- pszCSEWeatherPath is a null terminated string containing path (including trailing '\') of the directory where the CSE weather files reside. In the CBECC-Res installer, this would be: '<Program directory>\CSE\'.
  Weather files from this directory are copied into the processing directory immediately prior to simulation.
- pszDHWDLLPath (no longer used)
- pszDHWWeatherPath (no longer used)
- pszProcessingPath is a null terminated string containing the path (including trailing '\') of the directory where the simulation inputs and outputs will be written.
- pszModelPathFile is a null terminated string containing the path and filename of the building model input (.ribd or .ribd16 native format inputs or XML with extension .xml, .ribdx or .ribd16x) file. The file identified by this argument may or may not be loaded into memory during the simulation processing depending on a subsequent argument.
- pszLogPathFile is a null terminated string containing the path and filename of file to write processing messages to. If specified as NULL (which it typically is), then the log file will be equivalent to the pszModelPathFile specified in the previous argument, but with the file extension replaced with '.log'.
- pszUIVersionString is a null terminated string containing the name and version/ID of the application that is calling this function. This information is stored in the data model for later reporting in CSV results export and (potentially) final compliance reports.
- bLoadModelFile is a boolean indicating whether or not to read the building model (pszModelPathFile) into memory prior to simulation. This should be specified as 'true' (non-zero) unless the calling application has already loaded the building model into memory via a previous call.
- pszAnalysisOptionsCSV is a null terminated string containing a comma separated value (CSV) format for any/all of a number of the following analysis options:
  - FullComplianceAnalysis: boolean (0/1 – default 1): whether or not multiple runs are to be performed during the analysis. When performing a single simulation (w/ Proj:AnalysisType = "Research" or "Proposed Only"), then this flag should be set to 0 and a value of 1 (the default) when Proj:AnalysisType = "Proposed and Standard".
  - InitHourlyResults: booean (0/1 – default 1): whether or not to initialize all hourly results storage prior to performing the simulation. This argument should be 1 (the default) for any individual simulation runs or the first simulation of a multiple compliance simulation run sequence.
  - StoreBEMProcDetails: boolean (0/1 – default 0): whether or not to store detailed building energy model ('.ibd-detail') files during the course of the model defaulting and simulation. Typically set to 1 in testing/debugging phases and turned off (value of 0, the default) for distribution to users (to save time and file I/O).
  - Verbose: boolean (0/1 – default 0): whether or not to write messages to the log file for each rule evaluated on the model and identifying each step in the analysis sequence. Typically set to 1 in testing/debugging phases and turned off (value of 0, the default) for distribution to users (to save time and file I/O – can cause very large log files).
  - PerformRangeChecks: boolean (0/1 – default 1): whether or not to perform range checks on model inputs following the reading and initialization of the building model (pszModelPathFile).

This option should be set to 1 (the default) unless performing runs where violation of the range checks should not terminate the analysis.

- PerformSimulations: boolean (0/1 – default 1): whether or not to perform CSE & T-24 DHW simulations for each model defined for the analysis. This argument should be 1 (the default) except for testing/debugging scenarios where the contents of simulation inputs (and not the simulations results) and or building summary reports are the desired output.
- BypassCSE: boolean (0/1 – default 0): whether or not any/all CSE simulations should be bypassed during the course of performing the analysis. This is typically activated (set to 1) only when performing software testing/debugging.
- IgnoreFileReadErrors: boolean (0/1 – default 0): whether or not analysis should be aborted if errors are encountered while reading building model (project) data from input file.
- ComplianceReportPDF: boolean (0/1 – default 0): whether or not a PDF compliance report will be generated at the conclusion of the analysis, assuming no errors have occurred and no checks or simulation runs were bypassed. In the event a compliance PDF is generated, the file will be located in the project directory and named:
  <project file name> - CF1RPRF01E-BEES.pdf
- ComplianceReportXML: boolean (0/1 – default 0): whether or not a full (XML) compliance report will be generated at the conclusion of the analysis, assuming no errors have occurred and no checks or simulation runs were bypassed. Full XML compliance reports include all analysis inputs and results as well as an imbedded PDF report. In the event a XML compliance report is generated, the file will be located in the project directory and named:
  <project file name> - CF1RPRF01E-BEES.xml
- Silent: boolean (0/1 – default 0): whether or not dialog boxes are permitted to be presented during the analysis. One example is a dialog indicating that a file needing to be written during/following the analysis cannot be written to, prompting the user to close the file in another application it is opened in so that the file can be re-written. A value of '1' will prevent user prompts and issues such as files unable to be written may cause the analysis to be aborted.
- ExportHourlyResults_p: boolean (0/1 – default 0): whether or not CSV files of hourly simulation results (& TDV multipliers) are exported for the run specified by the character(s) trailing the '_' in the option name string. The CSV file(s) generated will be located in the same directory as the project/model input file, with "<ProjectFile> - <RunAbbrev> - HourlyResults.CSV".
  Valid trailing run abbreviation characters include:
  "_p": proposed model (of compliance analysis)
  "_s": standard model (of compliance analysis)
  "_dr": design rating model (of compliance EDR analysis)
  "_u": user-input model (when simulating in 'research' mode)
  "_p-N": the proposed North orientation run (when performing All Orientation compliance)
  "_p-E": the proposed East orientation run (when performing All Orientation compliance)
  "_p-S": the proposed South orientation run (when performing All Orientation compliance)
  "_p-W": the proposed West orientation run (when performing All Orientation compliance)
  "_pfx": the proposed flexibility run (when flexibility design features selected)
  "_pfx-N": the prop flexibility North orientation run (for All Orientation compliance)
  "_pfx-E": the prop flexibility East orientation run (for All Orientation compliance)
  "_pfx-S": the prop flexibility South orientation run (for All Orientation compliance)
  "_pfx-W": the prop flexibility West orientation run (for All Orientation compliance)

- ProxyServerAddress: character string: The address (i.e. “site.site:port”) of the proxy server to be used in accessing the report generator (via the internet).
- ProxyServerCredentials: character string: Username and password credentials (i.e. “username:password”) needed to access the internet via the proxy server (only needed for report generation).
- ProxyServerType: character string: options include ‘Http’ (default), ‘Socks5’, ‘HttpCaching’ and ‘FtpCaching’.
- BypassRuleLimits: boolean (>=0 – default 0): whether or not a variety of compliance analysis limits on property values and functionality are enforced during analysis. This option is used primarily by rule developers to test new/upcoming compliance analysis changes that are not allowed in a current, official compliance analysis run.
- BypassValidFileChecks: boolean (0/1 – default 0): whether or not valid file checks are performed during compliance analysis. These checks are not time consuming and should always pass for installations of CEC-certified software, but when performing analysis using interim program versions, then this option will prevent the logging of potentially numerous file hash check errors.
- LogWritingMode: integer (0-2 – default 2): the method used to write messages to project log files.
  0. log file flushed and closed following each write (slower, but ensures complete log file)
  1. log file populated in memory and only flushed/refreshed periodically (faster writing)
  2. causes use of method '1' if any detailed logging activated (when VerboseInputLogging, LogRuleEvaluation, or DebugRuleEvalCSV are specified), otherwise '0'
- SimSpeedOption: integer (-1 thru 1 – default -1): specifies what simulation speed option to use during analysis:
  -1: Whatever is specified in the project file (or will default to 0-Compliance)
  0: Compliance – simulation settings that ensure accurate compliance results
  1: Quick – settings that cause faster simulations w/ slightly less accurate results
- EnableRptGenStatusChecks: boolean (0/1 – default 1): whether or not to confirm that the report generator website is accessible prior to initiating report generation. Enabling this check can help to minimize processing time in cases where the report generator is not currently available. In those cases, the processing can be held up for several seconds, much longer than it takes to check the site’s availability. This feature can be disabled by passing a ‘0’ here if this report gen checking feature causes problems on certain systems/networks.
- AllowAnalysisAbort: boolean (0/1 – default 1): whether or not the analysis abort button (in the analysis progress dialog) will be activated and allowed to cause the analysis to be terminated when pressed. Setting this value to ‘0’ can help to prevent inadvertent ‘abort’ actions when performing batches of multiple runs.
- StoreResultsToModelInput: boolean (0/1 – default 0): whether or not to store results of the analysis back to the original project input file. This is how CBECC-Res facilitates display of analysis results after the calculations and later re-loading the project. No changes are made to the original model inputs that are used to calculate building compliance.
- SimReportDetailsOption; integer (0-2 – default 1): what post processing is performed on CSE simulation ‘report’ file output: 0 for no CSE report processing, 1 to echo only user-specified output reports and 2 to echo entire CSE report file. When > 0, a file is generated (in the project

file directory) by the name "<project filename> - CSE Reports.txt" that lists the specified CSE report data for each simulation performed during analysis.

- SimErrorDetailsOption; boolean (0/1 – default 1): whether or not to post process CSE simulation errors for easier access by users or vendor tools. When > 0, a file is generated (in the project file directory) by the name "<project filename> - CSE Errors.txt" that lists the specified CSE report data for each simulation performed during analysis.

Multiple analysis options can be concatenated into the pszAnalysisOptionsCSV string, for instance, if you wanted to perform a run with the Verbose & BypassCSE flags activated (and all other defaults used), then this function argument would include the string "Verbose,1, BypassCSE,1,".
Searches for options in this string argument are case insensitive and if a single flag is repeated multiple times, the value associated with its first occurrence will drive the analysis.

- pszErrorMessage is a pointer to a character string that can be populated by this function to describe error(s) encountered during the analysis. Pass in a value of 0/NULL if no return of error messaging is desired.
- iErrorMsgLength is an integer describing the number of characters present in the error message character string (previous argument). Pass in a value of 0 if no return of error messaging is desired.
- bDisplayProgress is a boolean indicating whether or not to display the analysis progress dialog as the processing is executed.
- hWnd is a HANDLE to a MS Windows application window. This hWnd is used in the call that initiates the CSE executable to identify the owner of the simulation process, but can be specified as NULL if not available.
- iSecurityKeyIndex is an integer value assigned to each certified software vendor that is used to identify which of a predefined number of security keys integrated into the compliance ruleset should be used to generate permit (secure) compliance reports immediately following the analysis.
  Contact the CEC and/or compliance engine software contractor for this index prior to submitting software to the CEC for certification.
- pszSecurityKey is a null terminated string containing a subset of a private security key which is used by the compliance engine to generate permit (secure) compliance reports immediately following the analysis.
  Contact the CEC and/or compliance engine software contractor for this character string prior to submitting software to the CEC for certification.

Return value is 0 if simulation successful and > 0 if errors occurred (listed below).

Call this routine once for each individual simulation to be performed.

All path/filename arguments can be either complete or relative to the path in which the calling executable resides.

Error return value mapping:

```
#define  BEMAnal_CECRes_EXEPathInvalid       1   //  pszCSEEXEPath doesn't exist
#define  BEMAnal_CECRes_WthrPathInvalid      2   //  pszCSEWeatherPath doesn't exist

```

Some errors in building model inputs that are checked and reported prior to performing analysis include:

Checks on any model simulated by the compliance manager (independent of compliance analysis):

- At least one Zone object must exist in the model
- When interior walls or floors specify a Garage zone as being on the Outside of the surface, then “Has Attached Garage” (Proj:HasGarage=1 / Project dialog, Building tab) must be selected.
- Each Zone and Garage must have at least 6 surfaces associated with it, including direct wall/floor/ceiling children and w/f/c children of other Zones that specify the Zone as being Outside that surface.
- Of the surfaces associated with each Zone and Garage, no single surface can have a larger area than ½ the sum of all associated surface areas.

```
int CMX_PerformAnalysisCB_CECRes(                const char* pszBEMBasePathFile,
            const char* pszRulesetPathFile,      const char* pszCSEEXEPath,
            const char* pszCSEWeatherPath,       const char* pszDHWDLLPath,
            const char* pszDHWWeatherPath,       const char* pszProcessingPath,
            const char* pszModelPathFile,        const char* pszLogPathFile,
            const char* pszUIVersionString,      bool bLoadModelFile,
            const char* pszAnalysisOptionsCSV,
            char* pszErrorMessage,               int iErrorMsgLength,
            bool bDisplayProgress,               int iSecurityKeyIndex,
            const char* pszSecurityKey,
            PAnalysisProgressCallbackFunc pAnalProgCallbackFunc );

      // typedef int  (__cdecl *PCMX_PerformAnalysisCB_CECRes)(  const char*,
      //                      const char*, const char*, const char*,
```

```
//                      const char*, const char*, const char*,
//                      const char*, const char*, const char*, bool,
//                      const char*, char*, int, bool, int, const char*,
//                      PAnalysisProgressCallbackFunc );
// _CMX_PerformAnalysisCB_CECRes
```

This is an alternative compliance analysis routine as the one listed above (CMX_PerformAnalysis_CECRes). The function arguments are identical to the above routine with the exception of the final one, replacing HWND* with a pointer to a callback function. The return value is also the same as above.

This callback function referenced by the final function argument is called each time the analysis progress is checked/reported, enabling calling applications to monitor analysis progress and abort analysis prior to completion without using the analysis progress dialog available in the compliance engine.

where:

- (refer to the previous routine for information on all arguments prior to pAnalProgCallbackFunc)
- pAnalProgCallbackFunc is a pointer to a callback function declared as:

```
long (CALLBACK* PAnalysisProgressCallbackFunc)(    long lAnalProgType,
                                                   long lData   )
```

  where:

  lAnalProgType is either 0 (processing message) or 1 (percent progress reported), and
  lData is either percent progress (0-100 when lAnalProgType = 1) or unused/nothing

  A return value of 0 from the callback function will cause analysis to continue and a return value > 0 will cause the analysis to be aborted.

```
int CMX_CheckSiteAccess( const char* pszSite,   const char* pszCACertPath,
                  const char* pszProxyAddress,  const char* pszProxyCredentials,
                  char* pszErrorMessage,        int iErrorMessageLength,
                  bool bVerbose,                const char* pszProxyType,
                  const char* pszNetComLibrary  );

      // typedef int (__cdecl *PCMX_ CheckSiteAccess(  const char*,
      //                 const char*,  const char*,  const char*,  char*,  int,
      //                 bool,  const char*,  const char*  );
      // _CMX_ CheckSiteAccess
```

This function enables the calling application to determine whether or not the CEC Report Generator website is accessible and available to process compliance reports.

where:

- pszSite is a null terminated string containing the URL of the website to check for access. This site is stored in ruleset source for each program release as Proj:RptGenCheckURL. For release 2016.1.0 and 2013 ver 3d the site is: "https://t24docs.com/RGServiceStatus/RGServiceStatus.svc/IsResServiceActive"
- pszCACertPath (no longer used).
- pszProxyAddress is a null terminated string containing the address (i.e. “site.site:port”) of the proxy server to be used in accessing the report generator (via the internet). If no proxy server is present, then pass 0 (NULL) for this argument.

- pszProxyCredentials is a null terminated string containing the username and password credentials (i.e. “username:password”) needed to access the internet via the proxy server. If no proxy server is present or no credentials are required to negotiate the proxy server, then pass 0 (NULL) for this argument.
- pszErrorMessage is a pointer to a character string that can be populated by this function to describe error(s) encountered during execution. Pass in a value of 0 (NULL) if no return of error messaging is desired.
- iErrorMessageLength is an integer describing the number of (single-byte) characters present in the error message character string (previous argument). Pass in a value of 0 if no return of error messaging is desired.
- bVerbose is a Boolean indicating whether or not to write messages to the current project log file indicating each step of the site access execution. This argument should be set to ‘true’ only if analysis has just been executed on a model or a model has been loaded into memory using some other means.
- pszProxyServerType is a null terminated string describing the type of proxy server needing to be negotiated to access the internet. Options include ‘Http’ (default), ‘Socks5’, ‘HttpCaching’ and ‘FtpCaching’.). If no proxy server is present, then pass 0 (NULL) for this argument.
- pszNetComLibrary (no longer used – pass ‘0’ (NULL) for only option of QT)

Return values from this routine include:

```
   -1    website accessed but report generator is offline
   -2    website accessed using supplied proxy server settings, but report generator is offline
   -3    website accessed using proxy server settings retrieved from system, but report generator is
         offline
  -11    website accessed and report generator is available
  -12    website accessed using supplied proxy server settings and report generator is available
  -13    website accessed using proxy server settings retrieved from system and report generator is
         available
  100    pszSite contained BEMBase Object:Property, but error retrieving URL using that obj:prop name

 And errors related to the QT network library:
    1    Invalid storage path for webpage download
    2    Error encountered downloading webpage (typically error negotiating w/ local proxy server)
    3    Unable to write file downloaded from website (file locked by another application)
    7    Unable to connect either directly or via proxy server settings retrieved from the operating
         system
    8    Unable to connect via supplied proxy server settings
    9    Error initializing temporary file path to copy site status to internal buffer
   10    Error initializing temporary file to copy site status to
```

```
int CMX_GenerateReport_CEC( const char* pszXMLResultsPathFile,
                  const char* pszCACertPath,    const char* pszReportName,
                  const char* pszAuthToken1,    const char* pszAuthToken2,
                  const char* pszSignature,     const char* pszPublicKey,
                  const char* pszDebugBool,     bool bVerbose,   bool bSilent,
                  bool bSchemaBasedRptGen );

      // typedef int (__cdecl *PCMX_GenerateReport_CEC(  const char*,
      //                const char*, const char*, const char*, const char*,
      //                const char*, const char*, const char*, bool, bool, bool );
      // _CMX_GenerateReport_CEC
```

where:

- pszXMLResultsPathFile is a null terminated string containing the path and filename of the analysis results XML file. This is typically: <Project file directory>\<project file name> - AnalysisResults.xml
- pszCACertPath (no longer used)
- pszReportName is a null terminated string containing the name of the report to be generated. Valid report names currently include:
  - "CF1R_NCB_PRF19": 2019 CF-1R Cert. of Compliance when Proj:RunScope = "Newly Constructed"
  - "CF1R_ALT_PRF19": 2019 CF-1R Cert. of Comp. when Proj:RunScope = "Addition and/or Alteration"

  No CAHP reports available in 2019 releases: Reports added in version 2016-3b (685) supporting the CAHP-SF / CAHP-MF / CMFNH programs:
  (note: appropriate CAHP inputs must have been provided prior to performing analysis)
  - "CAHPSFSO": CAHP single family program, single orientation analysis
  - "CAHPSFMO": CAHP single family program, all orientation analysis
  - "CAHPMFSO": CAHP multifamily program, single orientation analysis
  - "CAHPMFMO": CAHP multifamily program, all orientation analysis
  - "CMFNHSO": PG&E CMFNH program, single orientation analysis
  - "CMFNHMO": PG&E CMFNH program, all orientation analysis
- pszAuthToken1 is a null terminated string that, combined with AuthToken2, identifies the calling application. When called from CBECC-Res this argument is "CBECC-Res" and when called from other certified software this argument should be specified based on instructions from the CEC and/or CEC contractor supplying vendor-specific software distributables.
- pszAuthToken2 is a null terminated string that, combined with AuthToken1, identifies the calling application. When called from CBECC-Res 2013 version 4 (*) this argument is "4", from CBECC-Res 2016.1.0 this argument is "1" **(new version # here)** and when called from other certified software this argument should be specified based on instructions from the CEC and/or CEC contractor supplying vendor-specific software distributables.
- pszSignature is a null terminated string containing the base-64 ASCII-encoded signature used to sign request data. Signature processing is not yet implemented, so for the time being the string "none" should be supplied for this argument.
- pszPublicKey is a null terminated string containing the base-64 ASCII-encoded public key used to sign request data. Signature processing is not yet implemented, so for the time being the string "none" should be supplied for this argument.
- pszDebugBool is a null terminated string containing either the word "true" or "false". Passing "true" (the current default) causes the report generator to activate debugging features.
- bVerbose is a boolean flag (not in the form of a character string) indicating whether verbose information should be written to the project processing log file.
- bSilent is a boolean flag (not in the form of a character string) indicating whether or not dialog boxes are permitted to be presented during the report generation. One example is a dialog indicating that the file needing to be written to contain the compliance report cannot be written to, prompting the user to close the file in another application it is opened in or change the file permissions so that the file can be re-written. A value of '1' will prevent user prompts and issues such as files unable to be written may cause the report generation to be aborted.
- bSchemaBasedRptGen is a boolean flag (not in the form of a character string) indicating whether or not the report is generated from analysis results XML data governed by a schema (such as CF1RPRF01E.xml).

For the time being, the report file written will be located in the same directory as the analysis results XML file and will be named: "<analysis results filename>-BEES.PDF" (or .XML, depending on the … argument).

Reports produced via this API function will always include a watermark (such as "Not useable for compliance") indicating that the report is not valid compliance documentation (since there is no guarantee that the results XML file contains current analysis inputs and results). In order to generate a more formal certificate of compliance (such as one watermarked "This Certificate of Compliance is not registered"), you must generate the report via the CMX_PerformAnalysis_CECRes() API function, either by including "ComplianceReportPDF,1," in the pszAnalysisOptionsCSV argument or by analyzing a model where Proj:ComplianceReportPDF = 1.
For more information about compliance report watermarks, refer to the FAQs listed in the CBECC-Res Quick Start Guide.

Return values from this routine include:

```
 0   Success - no errors
 1   XML file not found
 2   CACert file not found
 3   Error opening and/or reading the analysis results XML file
 4   Error allocating memory for XML file storage
 5   User chose not to overwrite output report file
 6   Error opening report output file
 7   Error reading analysis results XML file
 8   Error reading analysis results XML file
 9   Error initializing CURL (curl_easy_init() returned NULL)
10   Report generation processing error in send request
11   Report generation processing error in result retrieval
12   No Report Name specified
13   Missing or invalid PDF Only boolean string (must be 'true' or 'false' (case insensitive))
14   Missing or invalid report generation debug boolean string (must be 'true' or 'false' (case
     insensitive))
15   Missing or invalid AuthToken1 string
16   Missing or invalid AuthToken2 string
17   Missing or invalid Signature string
18   Missing or invalid PublicKey string
19   Error opening output file following report generation
20   Error reading data from output file following report generation
21   PDF report contains XML data - likely error messages from web server
22   XML Path not specified
23   CACert path not specified
24   CACertPath not a valid or found directory
25   Error converting results file signature to hexadecimal
26   Report generator found errors in analysis inputs and/or results
```

```
int CMX_GenerateReport_Proxy_CEC( const char* pszXMLResultsPathFile,
                  const char* pszCACertPath,    const char* pszReportName,
                  const char* pszAuthToken1,    const char* pszAuthToken2,
                  const char* pszSignature,     const char* pszPublicKey,
                  const char* pszProxyAddress,  const char* pszProxyCredentials,
                  const char* pszDebugBool,     bool bVerbose,   bool bSilent,
                  const char* pszCompRptID,     const char* pszRptGenServer,
                  const char* pszRptGenApp,     const char* pszRptGenService,
                  const char* pszSecKeyRLName,  const char* pszOutputPathFile,
                  const char* pszProxyType      const char* pszNetComLibrary,
                  bool bSchemaBasedRptGen );

      // typedef int (__cdecl *PCMX_GenerateReport_Proxy_CEC(  const char*,
      //                const char*,  const char*,  const char*,  const char*,
      //                const char*,  const char*,  const char*,  const char*,
      //                const char *,  bool,  bool,
```

```
//                const char*, const char*, const char*, const char*,
//                const char*, const char*, const char*, const char*, bool );
// _CMX_GenerateReport_Proxy_CEC
```

where:

- <arguments 1-7 and 10-12 same as those documented above for CMX_GenerateReport_CEC()>
- pszProxyAddress is a null terminated string containing the address (i.e. “site.site:port”) of the proxy server to be used in accessing the report generator (via the internet).
- pszProxyCredentials is a null terminated string containing the username and password credentials (i.e. “username:password”) needed to access the internet via the proxy server (only needed for report generation).
- pszCompRptID is a null terminated string containing report generator URL ID (default is “BEES”)
- pszRptGetServer is a null terminated string containing the report generator server name (default is “cf6r.com”)
- pszRptGenApp is a null terminated string containing the report generator server application name (default is “ReportGeneratorRes”)
- pszRptGenService is a null terminated string containing the report generator service name (default is “ReportingService.svc”)
- pszSecKeyRLName (unused)
- pszOutputPathFile is a null terminated string containing the name of the output report file (defaulting to “<project file>-<report name>.pdf”)
- pszProxyType is a null terminated string describing the type of proxy server, options include ‘Http’ (default), ‘Socks5’, ‘HttpCaching’ and ‘FtpCaching’.
- pszNetComLibrary is a null terminated string – no longer used (pass 0 (NULL))
- bSchemaBasedRptGen is a boolean flag (not in the form of a character string) indicating whether or not the report is generated from analysis results XML data governed by a schema (such as CF1RPRF01E.xml).

Allows for report generation where proxy server credentials are required to access the report generator website. All other information and return values are consistent with the CMX_GenerateReport_CEC() function described above.

```
int CMX_ExportCSVHourlyResults_CECRes(
            const char* pszHourlyResultsPathFile,     const char* pszModelPathFile,
            const char* pszModelName,
            char* pszErrorMessage,                    int iErrorMsgLength,
            bool bSilent,                             int iBEMProcIdx );

      // typedef int  (__cdecl *PCMX_ExportCSVHourlyResults_CECRes)(  const char*,
      //                      const char*, const char*, char*, int, bool, int );
      // _CMX_ExportCSVHourlyResults_CECRes
```

where:

- pszHourlyResultsPathFile is a null terminated string containing the path and filename of the CSV file you wish to be written by this routine.
- pszModelPathFile is a null terminated string containing the path and filename of the building model input file for which the results are being exported.
- pszModelName is a null terminated string containing one of the following:
  - for Research Mode analysis, the only option is “User”
  - for single-orientation compliance analysis, the options are “Proposed” and “Standard”
  - for all-orientation compliance analysis, the options are “Proposed-N”, “Proposed-E”, “Proposed-S”, “Proposed-W” and “Standard”
- pszErrorMessage is a pointer to a character string that can be populated by this function to describe error(s) encountered during CSV export process. Pass in a value of 0/NULL if no return of error messaging is desired.
- iErrorMsgLength is an integer describing the number of characters present in the error message character string (previous argument). Pass in a value of 0 if no return of error messaging is desired.
- bSilent is a boolean indicating whether or not to prompt the user when issues arise as, such as the CSV file being open in a separate application and must be closed in order to refresh/overwrite the file.
- iBEMProcIdx is used to identify the building model transform to pull results from. For residential compliance analysis (using procedural rulesets), always pass in a -1 for this argument.

Return value is 0 if CSV export is successful and > 0 if errors occurred (listed below).

Call this routine once immediately following execution of the analysis for each individual simulation for which results are to be exported.

All path/filename arguments should be complete, not relative to the path of the calling executable or building model file.

Error return value mapping:

1 : Error retrieving Proj:AnalysisType, AllOrientations, CondFloorArea, ClimateZone and/or NatGasAvailable
2 : Unable to open and/or write hourly CSV results file
3 : Error encountered opening hourly CSV results file
4: Error encountered opening hourly CSV results file

```
int CMX_GetDataString(  char* sReturnStr, int iRetStrLen, const char* pszCompParam,
                        const char* pszCompName,  BOOL bAddCommas,
                        int iPrecision,  const char* pszDefault );

      // typedef int  (__cdecl *PCMX_GetDataString)(  char*, int, const char*,
      //                                  const char*, BOOL, int, const char* );
      // _CMX_GetDataString
```

where:

- sReturnStr is a character string buffer to be populated with data from the building model.
- iRetStrLen is the number of characters allocated in the sReturnStr buffer. The returned string will be null-terminated, so the maximum number of characters written to sReturnStr will be (iRetStrLen-1).

- pszCompParam is a null-terminated string identifying the model object and property to return a string representation of. This argument can reference properties of any type in the data model (float, integer, object reference, enumeration or string). The object name and property name are separated by a colon, so this argument would contain 'Proj: CondFloorArea' to return a string-representation of the CondFloorArea property of the Proj (Project) object.
- pszCompName is a null terminated string containing the name of the object for which the object/property is to be returned. If there is only a single object of this type in the project (as is the case for Proj, EUseSummary and some other object types), then this argument can/should be set to NULL. If this argument is NULL for objects where multiple are present in the building model, then the property data for the "currently active" object of that type will be returned (not advised).
- bAddCommas is a BOOLean indicating whether or not commas (or related Windows Locale-based numeric separators) are to be included in the returned string. This argument is only referenced when returning string representations of integer or float object properties.
- iPrecision is an integer indicating the decimal precision to be used when populating the return string of float properties. Ignored for non-float properties.
- pszDefault is a null-terminated string containing the desired return string in the event the Object:Property being retrieved is not defined in the building model.

Return value is 0 if data retrieval is successful and > 0 if errors occurred.
<error return value info to be supplied at a later date>

Call this routine each time string data is to be retrieved from the building model.

```
int CMX_GetDataInteger( long* pReturnInt,  const char* pszCompParam,
                        const char* pszCompName,  long lDefault );

      // typedef int  (__cdecl *PCMX_GetDataInteger)( long*,  const char*,
      //                                              const char*, long  );
      // _CMX_GetDataInteger
```

where:

- pReturnInt is a pointer to a (32-bit) integer to be populated with data from the building model.
- pszCompParam is a null-terminated string identifying the model object and property to return the value of. This argument can only reference properties of integer or enumeration types in the data model. The object name and property name are separated by a colon in this string argument.
- pszCompName is a null terminated string containing the name of the object for which the object/property is to be returned. If there is only a single object of this type in the project (as is the case for Proj, EUseSummary and some other object types), then this argument can/should be set to NULL. If this argument is NULL for objects where multiple are present in the building model, then the property data for the "currently active" object of that type will be returned (not advised).
- lDefault is a 32-bit integer value which will be returned (via the pReturnInt argument) in the event the Object:Property being retrieved is not defined in the building model.

Return value is 0 if data retrieval is successful and > 0 if errors occurred.
<error return value info to be supplied at a later date>

Call this routine each time integer data is to be retrieved from the building model.

```
int CMX_GetDataFloat(   float* pReturnFlt,  const char* pszCompParam,
                        const char* pszCompName,  float fDefault );

      // typedef int  (__cdecl *PCMX_GetDataFloat)(   float*, const char*,
      //                                              const char*, float );
      // _CMX_GetDataFloat
```

where:

- pReturnFlt is a pointer to a (32-bit) float to be populated with data from the building model.
- pszCompParam is a null-terminated string identifying the model object and property to return the value of. This argument can reference properties of float, integer, enumeration or object reference types in the data model (returning a float value for an object reference property returns a 1-based index of the referenced object (among all objects of that type)). The object name and property name are separated by a colon in this string argument.
- pszCompName is a null terminated string containing the name of the object for which the object/property is to be returned. If there is only a single object of this type in the project (as is the case for Proj, EUseSummary and some other object types), then this argument can/should be set to NULL. If this argument is NULL for objects where multiple are present in the building model, then the property data for the "currently active" object of that type will be returned (not advised).
- fDefault is a 32-bit float value which will be returned (via the pReturnFlt argument) in the event the Object:Property being retrieved is not defined in the building model.

Return value is 0 if data retrieval is successful and > 0 if errors occurred.
<error return value info to be supplied at a later date>

Call this routine each time float data is to be retrieved from the building model.

```
int CMX_PopulateCSVResultSummary_CECRes(       char* pszResultsString,
                int iResultsStringLength,  const char* pszRunOrientation,
                int iResultsFormatVersion, const char* pszProjectPathFileName );

      // typedef int  (__cdecl *PCMX_PopulateCSVResultSummary_CECRes)
      //                      (  char*, int, const char*, int, const char*  );
      // _CMX_PopulateCSVResultSummary_CECRes
```

where:

- pszResultsString is a pointer to a character string of length (iResultsStringLength) that is to be populated with a summary of the analysis just performed.
- iResultsStringLength is the length of the character string (first argument) to be populated (recommended length 3,200 characters).
- pszRunOrientation is a pointer to a null-terminated character string that can serve to specify which of potentially several runs the CSV string is to be populated with. This argument is not referenced for

Research Mode or single orientation compliance analysis runs and simply passing in NULL is recommended.
For all orientation analysis, passing in NULL here will cause the worst case (least efficient) orientation run to be used to populate the CSV string. To specify the orientation to use, pass in 'N', 'E', 'S', or 'W' (case insensitive).

- iResultsFormatVersion is an integer which identifies what gets populated to the results CSV string. Valid values include:
  - 1 results in the original column definitions (as shown in the diagram below)
  - 2 will cause the string to have a column of data containing PV Credit inserted @ column AO (beginning in version 1c (496), dated 11/20/13, of the compliance manager)
  - 3 includes ver 2 plus inserts starting @ column CO proposed and standard model electric demand by endues, total and compliance total
  - 4 includes ver 3 plus additional columns beginning DK including total & compliance total savings percents for demand and TDV and CAHP-SF/CAHP-MF/CMFNH results
  - 5 includes ver 4 with the ProjectPathFileName inserted as column 2 (B), design rating result inserted at column 7 (G) and additional columns DZ-HV including proposed and reference design rating model electric, natural gas, other fuel and TDV energy use and electric demand
  - 6 includes ver 5 with adjustment of PV credit and design rating PV results
  - 7 includes ver 6 plus design rating PV-only and rating of standard design model
  - 8 includes ver 7 with changes for proposed PV kWh & kW reporting (for 2019 analysis)
  - 9 includes ver 8 with addition of overall model TDV by fuel (Elec, NatGas, Other)
  - 10 includes ver 9 with removal of CEC DHW sim engine version ID, addition of climate zone and # of dwelling units inputs, re-organization of demand results (now split out by run) and addition of Battery enduse results
  - 11 includes ver 10 with replacement of 9 old CAHP results w/ 16 new 2017 results (cols DX-EM)
  - 12 includes ver 11 with 3 additional sets of columns: Proposed PV Scaling (3), Target EDR (2), and Minimum Req'd PV (2) (cols JC-JI)
  - 13 includes ver 12 with Proposed & Standard design carbon emissions (cols JJ-JO)
  - 14 (10/6/17) includes ver 13 with 2 new sets of colums: Proposed & Standard design carbon emissions
  - 15 (1/4/18) includes ver 14 with 4 GHC (grid harmonization credit) columns
  - 16 (1/12/18) includes ver 15 with 3 Standard Design PV results (kWh, TDV & kW) added
  - 17 (1/29/18) includes ver 16 with added 102 columns to report emissions by model, fuel and enduse
  - 18 (9/30/18) includes ver 17 with 10 new columns labeled 'Reference Design Rating Model TDV (before fuel multiplier adjustment)' @ col IF
  - 19 (10/1/18) includes ver 18 with new Ref DRtg TDV (before fuel mult adj) moved from col IF to JY
  - 20 (2/8/19) includes major overhaul of CSV format, eliminating many unused columns, improving on the organization and consolidating C02-reporting format (tic #1053)
  - 21 (6/20/19) includes ver 20 with added columns documenting EDR1 (source energy TDV) to facilitate 2022 code research

  - -1 will cause the string to be populated with whatever data is consistent with the referenced version of the compliance manager (always the most recent results data)
- pszProjectPathFileName is a pointer to a null-terminated character string that can specify the full path and filename of the project file for which the analysis results were produced. If this data is not desired for inclusion in the result CSV string, then passing in NULL for this argument is recommended.

Return value is 0 if simulation successful and > 0 if errors occurred (listed below).

Error return value mapping:

1 : Error retrieving Proj:AnalysisType and/or Proj:CondFloorArea
2 : Error retrieving Proj:ResultSummary object
3 : Error retrieving Proj:ResultSummary object index
4 : Error retrieving EUseSummary:PassFail (compliance result)
5 : Error retrieving one or more Proj:RunResults results objects
6 : Error retrieving one or more Proj:RunResults results object indices
7: Error: Unexpected number of RunResults objects or error retrieving WorstOrientation index
8: Error: Unable to identify which run to return results for (based on pszRunOrientation argument)
9: Error: Unrecognized results format version argument (-1 => current, else 1-N)
10: Error retrieving Proj:ClimateZone and/or Proj:NumDwellingUnits (for format versions >= 10)

When loaded into Excel (and column titles added (see below)), this is what the results look like:
(note: see iResultsFormatVersion above for more info)
